Dr. Magda Marcon

Thinking women! - Compression-free 3D imaging with Breast CT

This presentation provides an in-depth introduction to breast CT. Following a brief overview of the modality, you will learn how a patient-centric examination is performed without the need for breast compression. The difference between projection-based breast imaging (mammography/DBT), dedicated breast CT and standard clinical CT will be explained. A major focus will be on clinical cases and image reading, and the possible applications of breast CT will be discussed.

What will you learn from this workshop?

- Understand the concept and relevance of breast CT
- Get a basic understanding of the technology; image quality and dose efficiency
- See how a breast examination is performed
- 3D image evaluation and best practices for reading
- Become familiar with typical (and some rather unusual!) cases for breast CT
- Learn where breast CT could be used on the clinical pathway to help improve the provision of women's healthcare

*This industry-sponsored session is part of the **EUSOBI 2021 ONLINE Congress in the Breast Cancer Awareness Month** (Oct 4th - 28th).*
